RR Mechatronics **Beleggersbijeenkomst**

27 November 2018
RRM, Zwaag

Our why

We, the team of RR Mechatronics, believe that every patient deserves the right diagnosis and care

Focusing on hematology, we help to provide precise and accurate laboratory measurements

By developing, producing, selling, and servicing state-of-the-art medical technology solutions

Introduction RRM

3000+ ESR instruments delivered
Worldwide
Smallest to largest labs
Single labs to largest chains
Gold Standard only

LEIDS UNIVERSITAIR MEDISCH CENTRUM

Introduction RRM

- RR Mechatronics established 1986
 - Zwaag The Netherlands
 - Providence, RI, USA
- Focus on hematology: ESR and RBC-analyzer
- World leader in ESR automation
 - Specialist in Westergren gold standard
- Instruments on all continents
 - Customers from research, small labs to worlds largest labs
- R&D, assembly & testing

The Medical Technology Company

- Medical Technology company
- State-of-the-art R&D
 - Processes, methodologies, regulatory, skills, high-class people
- Sublime regulatory environment
 - Greenlight.Guru implementation
- Strong growth due to alliances, commercial expansion
- NPD programs fuel further growth
 - State-of-the-art, Gold Standards, lower CAPEX, smaller footprint, higher uptime, improved ease-of-operation, increased recurring business model
 - Starrsed range, Lorrca-platform, RPI
 - Product Roadmap: Instruments, reagents, data

The Solutions from RRM

Starrsed, Lorrca & RPI

RRM lines of business

Starrsed ESR

- Gold Standard
- Global reach
- Market leader
- Fast growing
- Growth drivers
 - Lab automation
 - Emerging markets

Lorrca

- World leading hemorheology
- Patented Oxygenscan
- Growth drivers
 - Break-through position in SCD
 - Pharma: companion diagnostics
- Lorrca expandable platform technology: pipeline projects

RPI

- Next generation reagent re-constitution
- OEM-sales to large IVD players
- Allows for continued milking strategies
- OEM field introductions Q3-2019

- Recurring business model: Reagents, Controls, Parts

Starrsed range

- **Starrsed ESR = Westergren automated**

Lorrca reference instrument

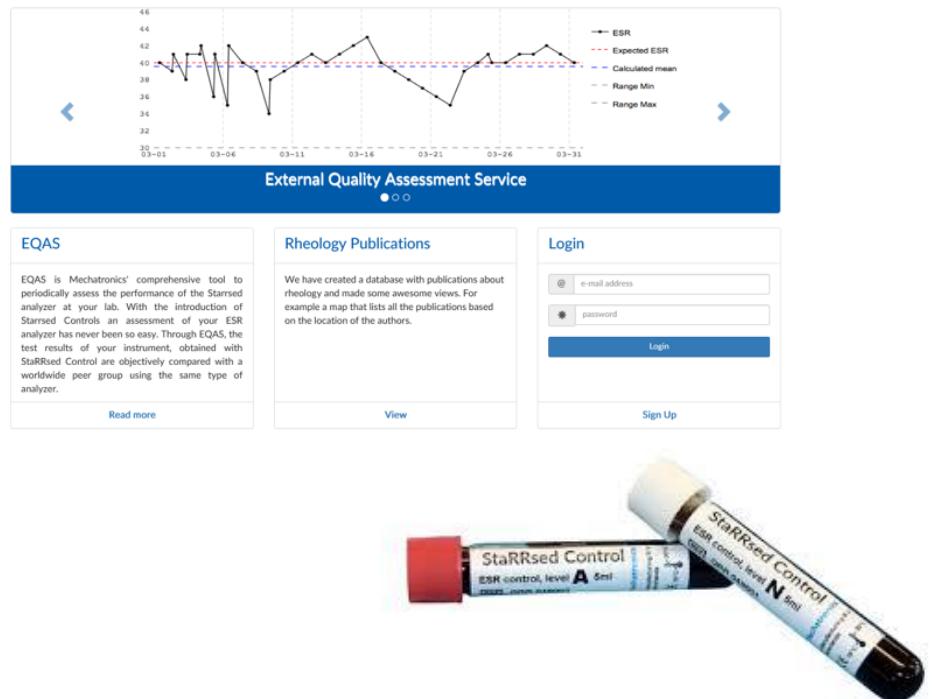

- Osmotic Fragility
- Erythrocyte Deformability
- Aggregation & Critical Stress
- Oxygenscan
 - Sickle Cell Disease (SCD)

- New generation reagent processing instrument

Solutions

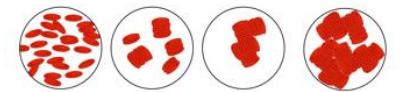

- **Starrsed Control & EQAS**

- **Starrsed Reagents**

- **Starrsed CAP-Accredited**

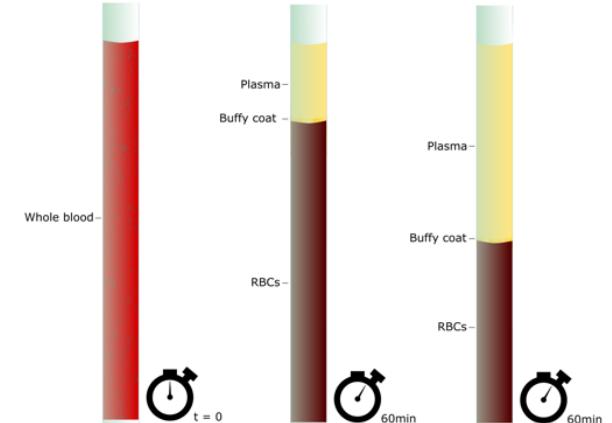

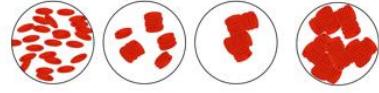

Gold Standard ESR

2. Westergren ESR without compromise

Westergren: Gold Standard ESR

- 2017 confirmation & definition:
Reference Method for ESR being Westergren
 - ICSH: International Council for Standardization Hematology
 - CLSI: Clinical Laboratory Standards Institute
- 1897 principle invention by Edmund Biernacki
- 1918 Fåhræus & Westergren added sodium citrate-anti-coagulation (minimizing Hct influence)
- 1987 RR Mechatronics introduces first automated Westergren method

TABLE 5 ICSH recommendations for the use of modified and alternate ESR methods

4.1 | Modified and alternate methods to measure the ESR

As outlined, the traditional Westergren method has been replaced in most laboratories with novel instrumentation. Our surveys indicate that worldwide two-thirds of all laboratories now use modified or alternate ESR test methods for the measurement of the ESR (Table 2). These methods include centrifugation or the use of photometric rheology to measure Rouleaux formation. Results obtained with these diverse approaches can differ significantly from observations obtained with the Westergren method and from each other. In particular, while

| | |
|--|---|
| Manufacturers' Obligations | <p>Clearly mark alternate methods as "modified" or "alternate"</p> <p>Determine the closeness of agreement with Westergren methods</p> <p>Determine and indicate the imprecision (reproducibility) of the method</p> <p>List all known interferences and indicate the level at which interference starts as well as the magnitude of the interference</p> <p>Determine age- and gender-specific reference ranges</p> <p>Provide all known information on disease-specific sensitivity and specificity</p> |
| Performing Laboratories' Obligations: | <p>Perform studies to determine the suitability of the method for their patient population</p> <p>Verify the reference ranges provided by the manufacturer</p> <p>Consider adding an interpretative comment to every result stating that "This result was obtained with an ESR instrument that is not based on the standard Westergren method. The sensitivity and specificity of this method for various disease states may be different from the standard Westergren method"</p> |

Reagent Processing Instrument

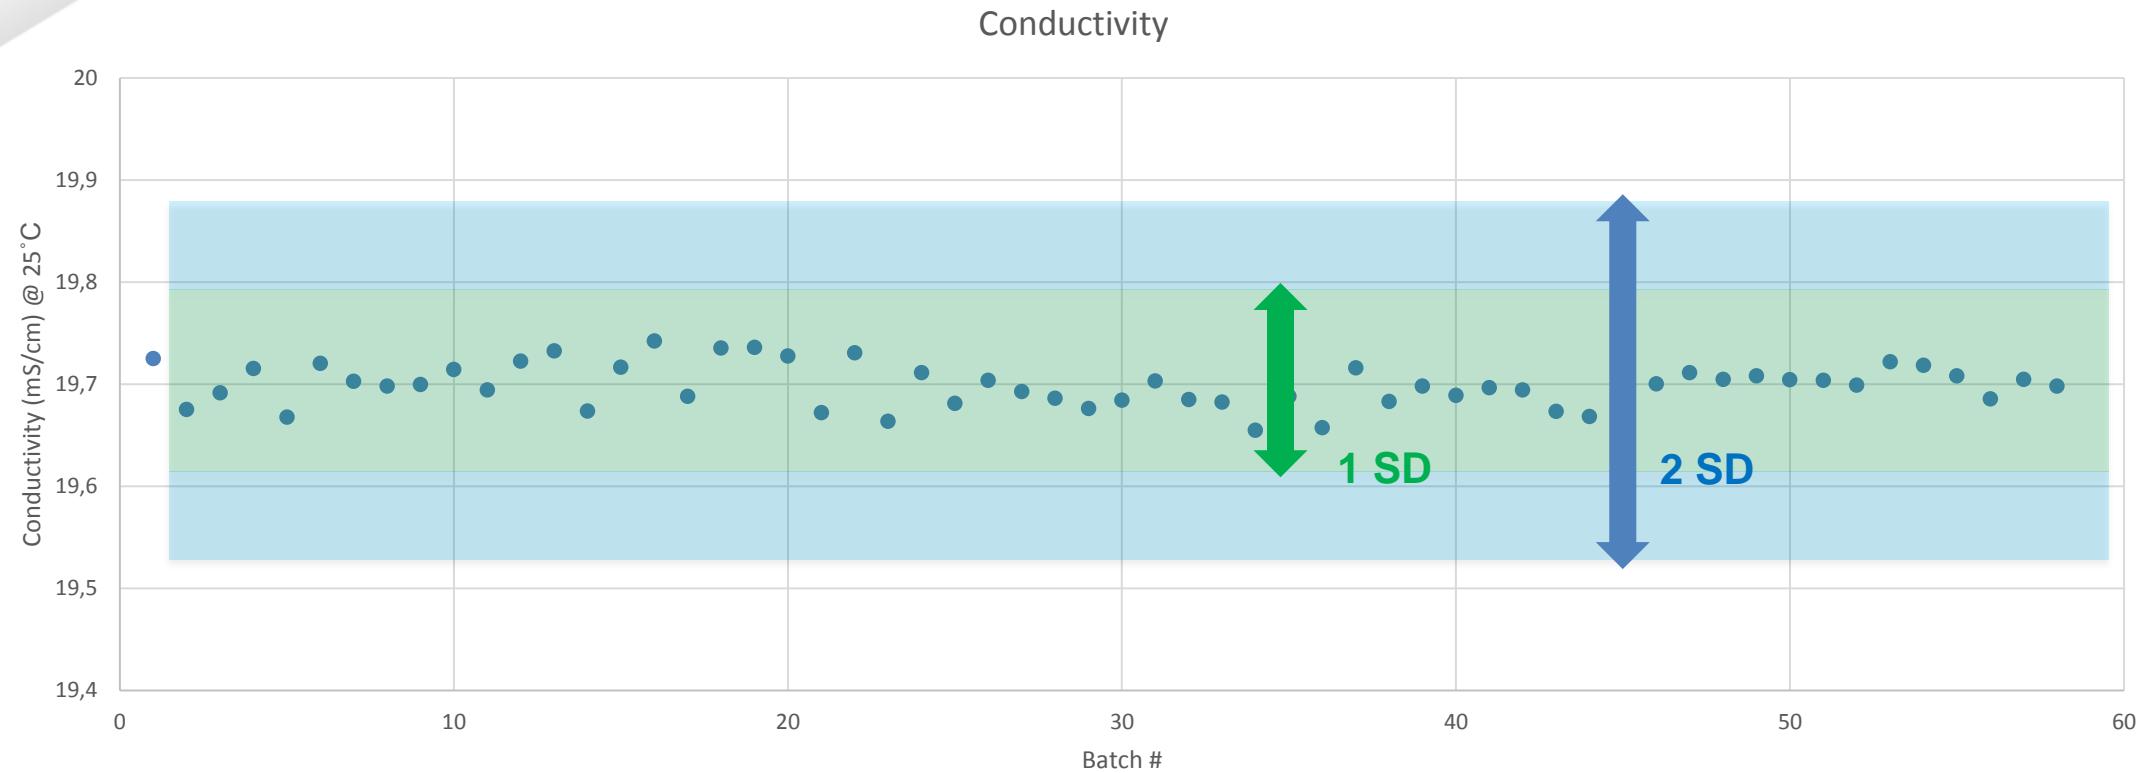

RPI Benefits

1. **Logistics savings** using your concentrated reagent
2. Maximized **uptime** for the analyzers
3. **Lowest cost** of ownership
4. **Minimal** user interaction
5. High product **output**
6. High reconstitution **accuracy**
7. Optimized concentrate **extraction**
8. Autonomous **QC** to ISO/NIST reference standard
9. **User traceability** through clearance levels with ID & PW
10. **Logistics traceability** through NFC tags
11. Retrievable **log** of performance and events
12. Low **energy** consumption
13. Product purity through incorporation of Merck Millipore **AFS-24**
14. Smallest install base **footprint**

Graphical user interface

Reconstitution accuracy & consistency

Final conductivity-distribution shows reconstitution accuracy and consistency well within the required specifications.

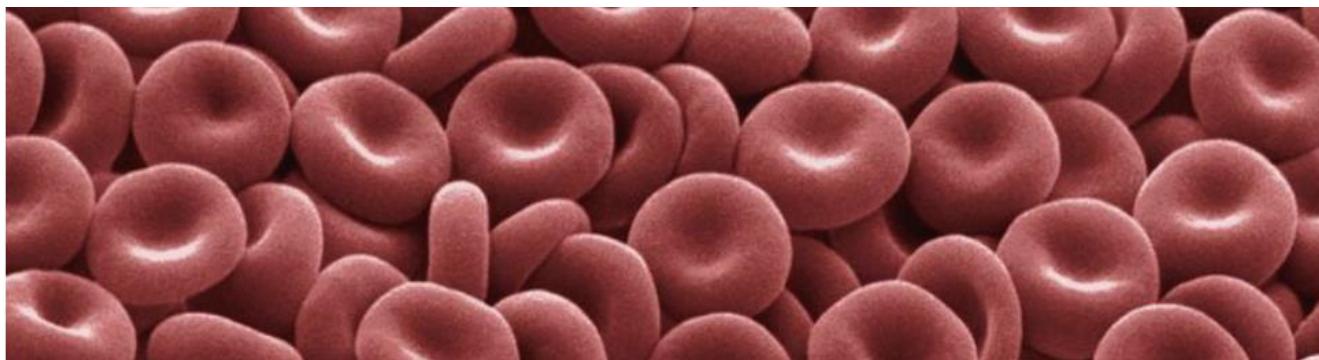

Lorrca platform

Functional Hematology

The Lorrca Platform

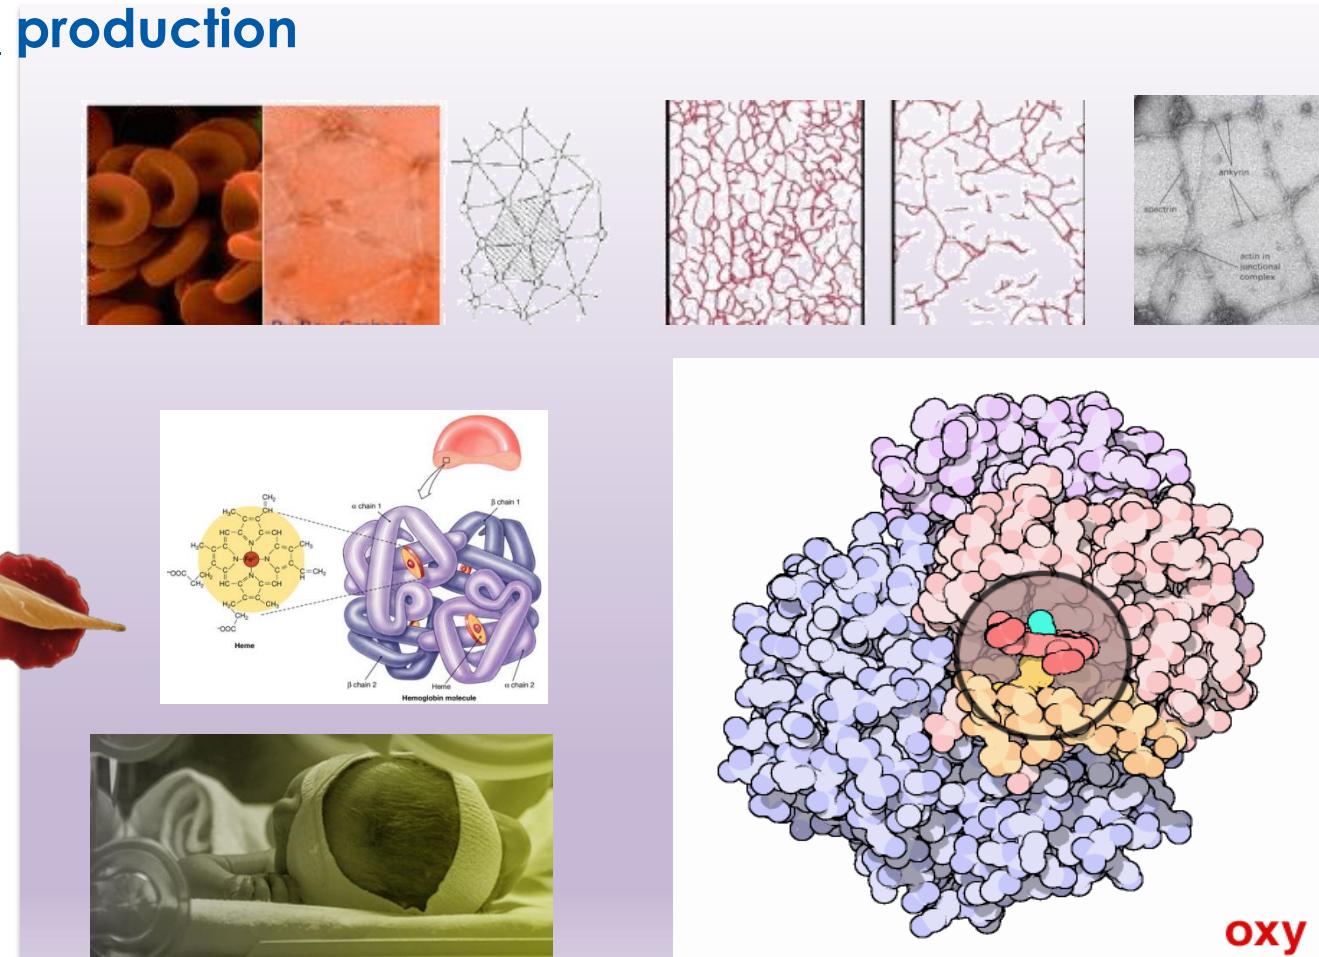

Functional Red Blood Cell
Analysis

Validated Technology

- The Lorrca instrument (ektacytometer) is already on the market for over 10 years.
- For most of these instruments the RBC Deformability and Osmoscan application is used appearing in hundreds of scientific publications.
- Currently the instrument is used as a Research Use Only instrument.
- Several labs are using the Lorrca in a CLIA surrounding.

Hereditary Hemolytic Anemia

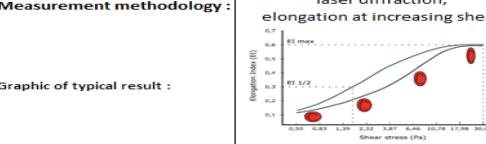

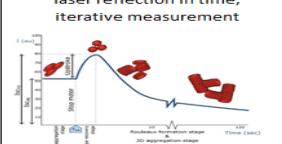

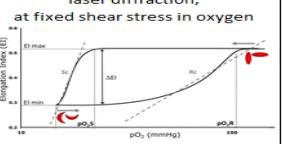

- **Defects of red blood cell membrane production**
 - h. Spherocytosis
 - h. Elliptocytosis
 - h. Stomatocytosis
- **Defects in hemoglobin production**
 - Sickle-Cell disease
 - Thalassemia (alpha/beta)
- **Defective red cell metabolism**
 - Pyruvate Kinase deficiency
 - G6PD enzyme deficiency (Malaria)

Lorrca applications

Lorrca is the main platform extended with new applications

Lorrca Oxygenscan

Sickle cell: 500 children die every day

Following requests from the professional field, the unique and patented Oxygenscan technology – dedicated to sickle cell disease (SCD) - is developed by RR Mechatronics

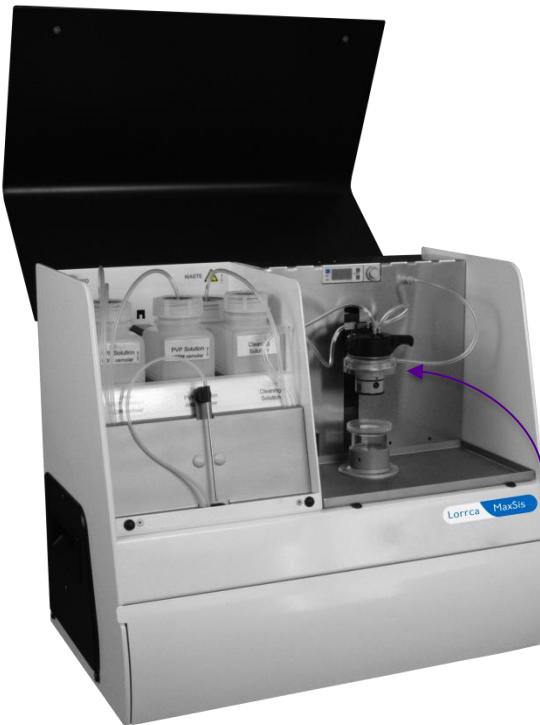

ASH 2016 goal for the future

- Identify predictors of the severity of the disease, including optimizing dosing and treatment response predictors for hydroxyurea, biomarkers for SCD crisis and prognosis, and SCD diagnostic methods.

Lorrca Oxygenscan

Unique patented technology measuring changes in erythrocyte deformability as a function of oxygen level

Request from the market develop for Sickle Cell Disease

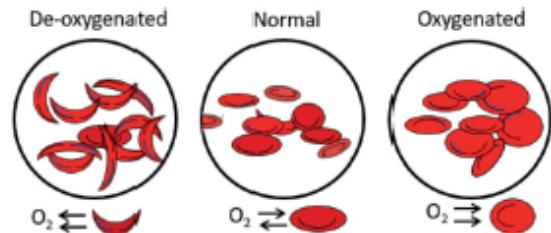

Methodology

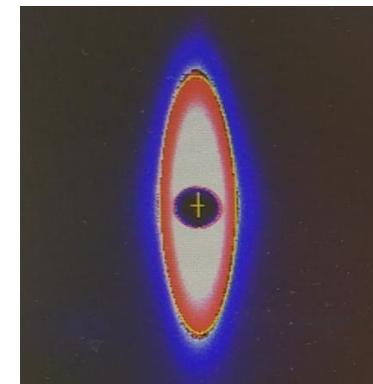

- Measurement of laser diffraction pattern of RBC, while in shear stress

Condition

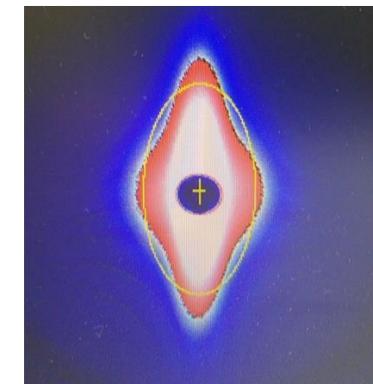

- In shear stress, a pO₂ gradient

RBC diffraction pattern of:
Healthy person

Sickle cell patient

De-oxygenated sickle cells

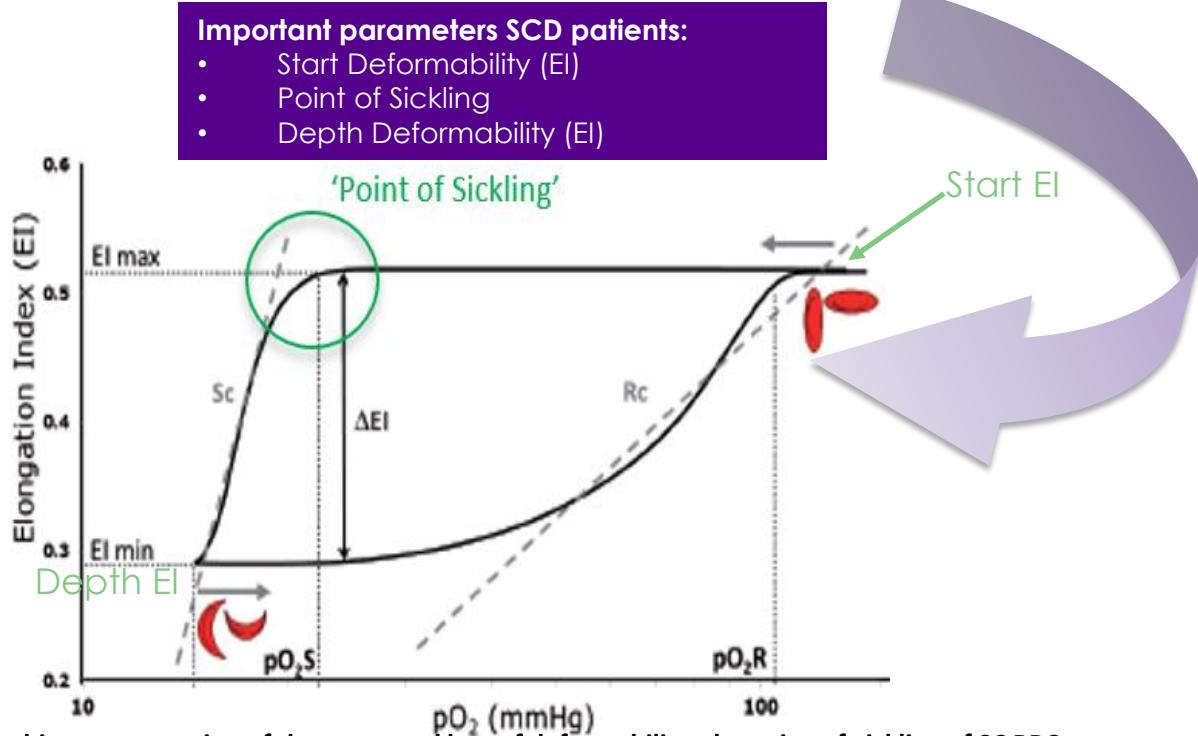

Figure 1. Graphic representation of the measured loss of deformability, the point-of-sickling of SC RBCs, as a result of oxygen-depletion in time, followed by subsequent gain of deformability of RBC's during reoxygenation, as is visualized on the Oxygenscan. It is described by pO_2 : Oxygen- pressure (controlled, in mmHg), and by EI: elongation index (of the RBCs in shear rate), in SC RBCs: Sickle Cell patients' Red Blood Cells.

Lorrca Oxygenscan

Lorrca Oxygenscan measures the 'Point of Sickling'

The Oxygenscan measures the relative oxygen pressure at the critical point where the RBCs of a SCD patient start to sickle. **This so called 'Point of Sickling' quantitatively and reproducibly describes the defined loss of deformability of SCD RBCs and therefore the severity of the disease and the sensitivity of the individual SCD patient in its response to treatment.**

Since there are no other technologies capable of detecting the individual patient's 'point of sickling', the Oxygenscan is providing a unique technology in the market place.

Poster #1452

THE OXYGENSCAN: CONTINUOUS MEASUREMENT AND QUANTIFICATION OF SICKLING DURING DE- AND REOXYGENATION TO MONITOR DISEASE SEVERITY AND TREATMENT EFFECT IN SICKLE CELL DISEASE.

Minke A.E. Rab^{1,2}, Brigitte A. van Oirschot¹, Tesy H. Merkx¹, Annet C.W. van Wesel¹, Sisto Hendriks³, Jan de Zoeten³, Eduard J. van Beers² and Richard van Wijk¹ and others

¹Laboratory of Clinical Chemistry & Haematology, University Medical Center Utrecht, ²Van Creveldkliniek, University Medical Center Utrecht, Utrecht, The Netherlands

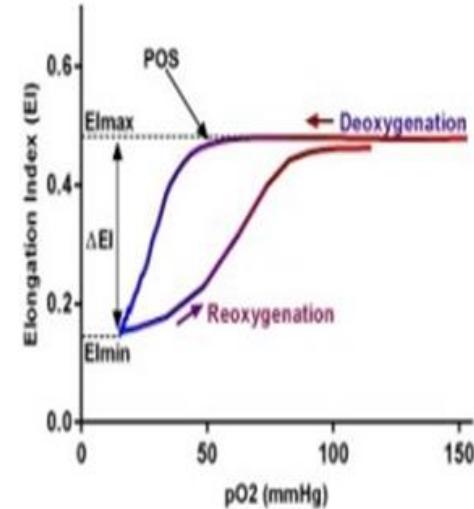

³RR Mechatronics, Zwaag, The Netherlands

Background: In sickle cell disease (SCD) a single point mutation in the gene encoding for beta-globin chain underlies the production of the abnormal hemoglobin S (HbS). Upon deoxygenation HbS can polymerize, resulting in sickling of red blood cells (RBCs). These sickled RBCs have strongly reduced deformability, leading to vaso-occlusive crises and chronic hemolytic anemia. To date, there are no laboratory parameters or assays capable of predicting disease severity or directly monitoring treatment effects.

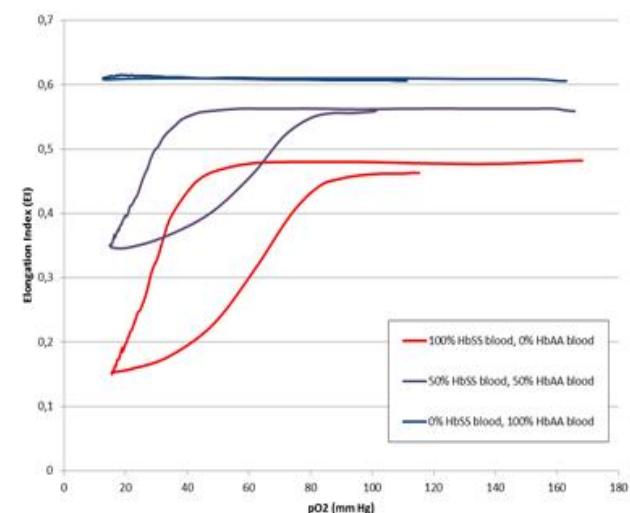

Aims: to develop and validate the Oxygenscan: a new method to investigate RBC deformability as a function of oxygen tension and thereby quantify sickling behavior in patients with SCD.

Continuous measurement and quantification of sickling during de- and reoxygenation to monitor disease severity and treatment effect in SCD
