

**Subject: Update New Product Development status**

**Date: 11-11-2024**

After having successfully developed the Starrsed NSTA, we have started the development of the next instrument in the ESR family. This will be the instrument with the highest ESR test throughput.

Development is progressing according to schedule with an expected launch mid 2025. Furthermore, we have been able to finalize a contract with one of our main customers to develop the communication of our instrument with the customers hematology solution. This is an important step for all parties involved.
